Надійшла 9 січня 2023 р.

Національна система сейсмічних спостережень України на сьогодні має мережу пунктів спостереження, які знаходяться у відомстві Інституту геофізики ім. С.І. Субботіна Національної академії наук та Головного центру спеціального контролю Державного космічного агентства України. На базі цих установ створено об'єднаний Національний центр даних, де проводяться збір, обробка та аналіз отриманих даних. Інформація надається як в оперативному режимі, так і після поглиблена аналізу у вигляді сейсмологічних бюллетенів та каталогів землетрусів.

За результатами інструментальних спостережень у 2021 р. на територіях України та суміжних держав відбулося більш ніж півтори сотні землетрусів, основна частина яких належить до глибокофокусної зони Вранча (Румунія). Максимальна зафіксована магнітуда землетрусу — 4,6. Землетруси з територій інших суміжних держав мали локальний характер і суттєво не впливали на сейсмічність території України. У межах території України землетрус з максимальною магнітудою відбувся 23 вересня на Тернопільщині. Його параметри $t_0=03:18:04$; $\phi=48,87^{\circ}\text{N}$; $\lambda=25,68^{\circ}\text{E}$; $h=6\text{ km}$; $m_b=4,3$.

Більшість епіцентрів зареєстрованих землетрусів в Україні знаходиться в межах Волино-Поділля та Передкарпатського прогину на межі Складчастих Карпат. У Кримсько-Чорноморському регіоні спостерігалася слабка сейсмічність, епіцентри землетрусів були зосереджені в межах морської акваторії.

Сейсмологічний бюллетень України містить детальну інформацію про всі сейсмічні події, що відбулися у 2021 р. на територіях України, Румунії, Польщі, Молдови, Словаччини, Угорщини та Білорусі.

Інформацію щодо кожного землетрусу з Каталогу землетрусів за 2021 р. у повному обсязі наведено у pdf-файлі цього бюллетеня на сайті «Геофизического журнала».

Ключові слова: землетрус, сейсмологічна мережа, магнітуда, епіцентральна відстань, зона Вранча, сейсмологічний бюллетень.

Вступ. Сейсмологічний моніторинг є невід'ємною частиною життєзабезпечення населених регіонів і систем забезпечення безпеки об'єктів критичної інфраструктури (атомних електростанцій, гідроелектростанцій, шахт, мостів, трубопроводів та ін.). Моніторинг включає не тільки реєстрацію, а й подальшу оперативну обробку та інтерпретацію сейсмологічних даних. Отримані в результаті обробки сейсмічних записів відомості

стосовно часу виникнення землетрусів, розміщення їх вогнищ та енергії спільно з даними щодо історичних землетрусів використовують для сейсмічного районування та оцінювання сейсмічного ризику території. Інша практична мета використання сейсмічного моніторингу — передбачення про сейсмічну небезпеку, яка виникає внаслідок тектонічної активності поблизу великих інженерно-технічних і екологічно-небезпечних об'єктів. Резуль-

тати сейсмічного моніторингу застосовують і для вирішення більш глобальних завдань сейсмології — вивчення внутрішньої будови Землі.

З метою підвищення безпеки проживання населення та експлуатації виробничих фондів у сейсмонебезпечніх регіонах країни, контролю за дотриманням вимог міжнародних договорів України щодо обмеження та заборони випробовувань ядерної зброї, вивчення сейсмічного та геогідроформаційного стану території України і суміжних держав Урядом було створено Національну систему сейсмічних спостережень України [Постанова..., 1995]. На сьогодні пункти спостереження Інституту геофізики імені С.І. Субботіна НАН України (ІГФ) і Головного центру спеціального контролю Національного центру управління та випробувань космічних засобів (НЦУВКЗ) Державного космічного агентства України фактично становлять всю мережу Системи реєстрації землетрусів (сейсмологічна мережа України), а їх обчислювальні центри разом утворюють Національний центр даних (НЦД) [Постанова ..., 1997]. Окрім завдань збору, архівування, обробки та аналізу геофізичних даних НЦД здійснює оперативне та методичне керівництво силами і засобами моніторингу, розвиває технічне, методичне та математичне забезпечення, інформує населення та державні органи влади, формує і публікує сейсмологічні бюллетені та каталоги.

Сейсмологічний бюллетень України, засновником якого свого часу була Кримська експертна рада з оцінки сейсмічної небезпеки і прогнозу землетрусів, публікувався щорічно до 2013 р. Однак після російської анексії території Автономної Республіки Крим випуск бюллетеня було тимчасово призупинено. У 2022 р. прийнято рішення про відновлення випуску спільнотого Сейсмологічного бюллетеня України за результатами проведення спостережень національною сейсмологічною мережею.

До бюллетеню увійшли землетруси, що відбулися у 2021 р. на території України та суміжних держав. Магнітуда зареєстрована-

них землетрусів на території України становить від 1,0 до 4,3 на глибинах 2—7 км. Сейсмологічною мережею зареєстровано також велику кількість промислових вибухів у гірничих виробках та кар'єрах Житомирської, Кіровоградської та інших областей України, які згодом публікуватимуться в національному сейсмологічному бюллетені для території України.

Природа сейсмічності території України зумовлена сусідством її західних, південно-західних і південних областей з потужним сейсмоактивним поясом планети, який утворився в результаті колізії Африканської, Аравійської і Євразійської тектонічних плит. Сучасний рух Африканської плити коливається від ~4 мм/рік у північно-західному напрямі до 10 мм/рік на північ у бік Євразійської плити. Границя Африкано-Євразійської плити складна і включає зони розтягу та переходні зони конвергентного режиму (стиснення). Це зближення почалося приблизно 50 млн років тому (Ма) і було пов'язане із закриттям моря Тетіс. Найвищий рівень сейсмічності в Середземноморському регіоні спостерігається вздовж еллінської зони субдукції на півдні Греції та зони північно-анатолійського розлому на північному заході Туреччини [Herman et al., 2015]. Більшість виділеної пружної енергії реалізується у вигляді землетрусів різної інтенсивності безпосередньо в Середземноморському поясі, але значна частина енергії передається в тектонічні структури відносно спокійної Східноєвропейської платформи, де можуть виникати небезпекні місцеві землетруси. Як свідчить історичний досвід, землетруси відбуваються в межах усіх давніх тектонічних платформ, хоча й набагато рідше, ніж у сейсмоактивних поясах [Kagan, 1999]. Причому землетруси на порівняно стабільних тектонічних платформах зазвичай призводять до значних економічних втрат через непідготовленість будівель і споруд до їх впливів. Так, землетрус у Криму 1927 р. спричинив руйнування «Ластівчого гнізда», побудованого на скельній основі [Національний..., 2007].

На всій території України відчуваються сильні підкорові землетруси зони Вранча (рис. 1). Домінують землетруси середньої глибини, що виникають всередині сейсмогенного тіла сейсмічної зони Вранча, що поширюється на глибину до 200 км. Ці землетруси є головним джерелом сейсмічної небезпеки як для Румунії, так і для сусідніх країн. Останні найпотужніші події з магнітудою 7,7 і 7,4 відбулись у 1940 і 1977 рр. відповідно, спричинивши значні широкомасштабні руйнування [Poiata et al., 2022]. Сейсмічний регіон Вранча визначається особливою концентрацією або кластеризацією землетрусів середньої глибини [Radulian, 2015].

До 40 % території України може бути охоплено безпосереднім впливом небезпечних сейсмічних подій і до 70 % — за-

гальним впливом землетрусів, підтоплень, зсувів, осідань та інших інженерно-геологічних процесів, які негативно позначаються на стійкості споруд [Немчинов та ін., 2013; Кендзера, 2015].

Національна сейсмологічна система спостережень України — це комплекс автоматизованих багатофункціональних систем, який складається зі стаціонарних сейсмологічних пунктів реєстрації сейсмічних хвиль, розподіленої системи передачі і збору сейсмологічної інформації та центру оперативного опрацювання даних, які надходять із пунктів реєстрації землетрусів. Пункти спостереження належать Інституту геофізики ім. С.І. Субботіна НАН України [Вербицький, Вербицький, 2011; Ганієв та ін., 2021] і Головного центру спеціального контролю НЦУВКЗ

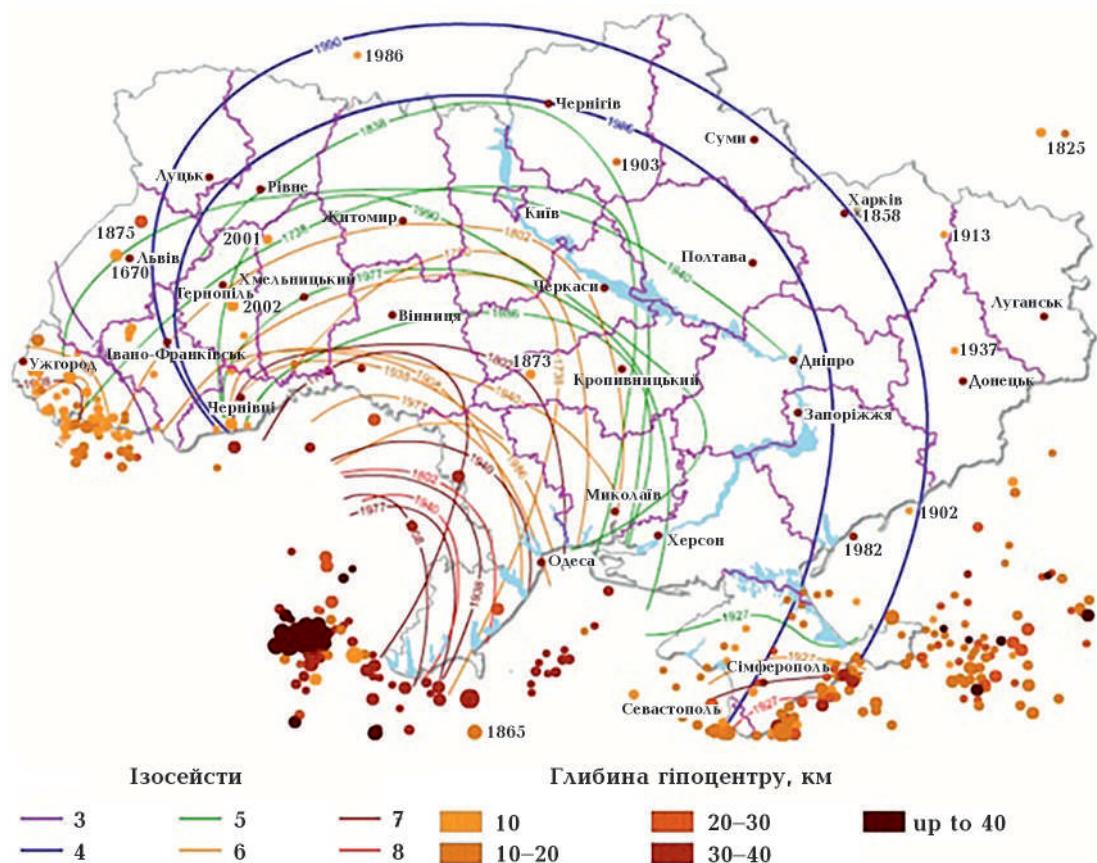

Рис. 1. Ізосейсти землетрусів зони Вранча, Румунія ($7,0 < M < 7,5$) на території України (1738, 1790, 1802, 1838, 1940, 1977, 1986, 1990 рр.) [Сагалова і др., 1969; Харитонов і др., 1996; Ніконов і др., 1996; Національний..., 2007].
Fig. 1. Earthquakes isoseists of the Vrancea zone ($7,0 < M < 7,5$) on the territory of Ukraine (1738, 1790, 1802, 1838, 1940, 1977, 1986, 1990 years) [Sagalova et al., 1969; Kharitonov et al., 1996; Nikonov et al., 1996; Rudenko, 2007].

ДКА України [Seismic..., 2010], а їх обчислювальні центри разом утворюють НЦД.

У бюллетені представлено параметри сейсмічних подій, визначення яких проводилося за результатами інструментальних спостережень сейсмологічною мережею України. Для уточнення параметрів сейсмічних подій також було залучено дані локальних сейсмологічних мереж Державного підприємства «Національна атомна енергогенеруюча компанія «Енергоатом» і закордонних сейсмологічних мереж [Mărmureanu et al., 2021; Андрушенко та ін., 2020]. Національну сейсмологічну систему спостережень території України становим на 2022 р. показано на рис. 2.

Мережа постійно діючих сейсмічних станцій Інституту геофізики НАН України є щільною в західних областях України (Закарпаття і Передкарпаття), обслуговується відділом сейсмічності Карпатського регіону ІГФ (рис. 2, табл. 1). На території Карпатського регіону України працює 22 сейсмічні станції, переважна більшість яких обладнана цифровими сейсмічними станціями DAS-04 [Кендзера та ін., 1998]. Київським відділом сейсмічної небезпеки обслуговуються сейсмічні станції: Kiev-IRIS (Київ), MI03 (Сквира, Київська обл.); MI05 (Степанівка, Одеська обл.), ODS (Одеса); MI07 (Миколаїв), MI02 (Полтава), MIU (Кривий Ріг), MI06 (Нова Галещина, Пол-

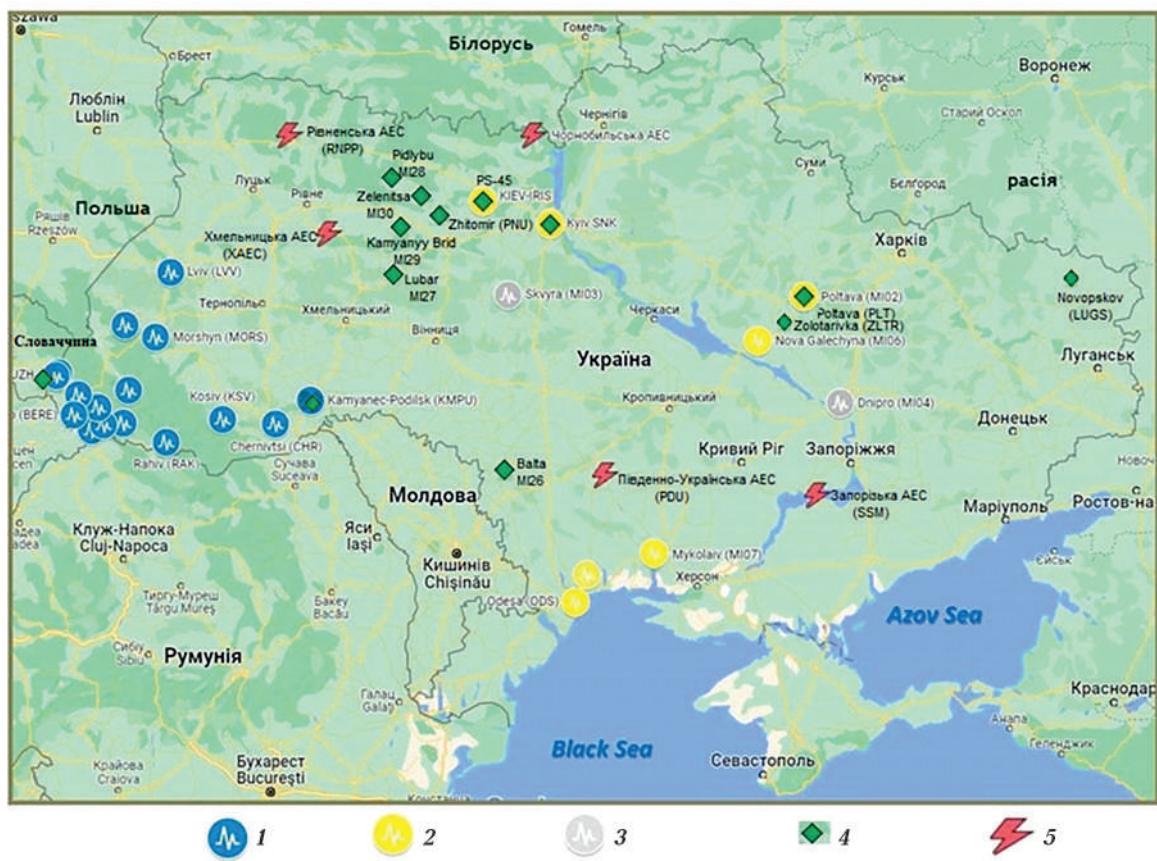

Рис. 2. Національна система спостережень території України включає сейсмологічні мережі, що обслуговуються: 1 — Карпатським відділом сейсмічності ІГФ, 2 (online) і 3 (out-of-line) — Київським відділом сейсмічної небезпеки ІГФ; 4 — Головним центром спеціального контролю Державного космічного агентства України; 5 — локальні сейсмологічні мережі ДП «НАЕК» ЕНЕРГОАТОМ навколо атомних електростанцій.

Fig. 2. The national observation system of the territory of Ukraine includes seismic networks served by: 1 — the Carpathian Seismic Department of the IGPH; 2 (online) and 3 (out-of-line) — the Kyiv Seismic Hazard Department of the IGPH; 4 — the Main Center of Special Control of the State Space Agency of Ukraine; 5 — local seismic networks of SE «NNEGC «Energoatom» around nuclear power plants.

тавська обл.), SNK (острів Зміїний, наразі сейсмодатчик знаходиться в приміщенні ІГФ і потребує калібрування).

Сейсмологічна мережа Головного центру спеціального контролю складається з 11 пунктів спостереження, більшість з яких розташовані в північній та центральній частинах території України. Пункти спостереження оснащені широкосмуговими цифровими сейсмічними станціями (див. табл. 1).

Крім того, Головним центром обслуговується автоматизований комплекс апаратури сейсмічного групування, включений як первинна станція (PS-45) до Міжнародної системи моніторингу. Угодою між Кабінетом Міністрів України і Підготовчим комітетом Організації договору про всеосяжну оборону ядерних випробувань, що ратифікована Верховною Радою України у 2000 р. Уряд взяв на себе зобов'язання щодо забезпечення всебічного функціонування станції. Станція являє собою територіально рознесену систему збору сейсмологічної інформації, що складається з 22 свердловинних елементів і одного шахтного, розташованого поблизу технічного майданчика (с. Ворсівка). Елементи станції об'єднані єдиною телеметричною системою, яка виконує функції збору інформації одночасно зі всіх елементів і централізованого управління елементами з технічного майданчика. Коливання ґрунту реєструються сейсмоприймачами виробництва компанії Guralp System Limited. У свердловинах встановлені вертикальні короткоперіодні сейсмоприймачі CMG-3ESPV, у шахті — трикомпонентний широкосмуговий сейсмоприймач CMG-3T. Сигнали від кожного датчика перетворюються в цифровий вигляд за допомогою аналого-цифрового перетворювача CMG-DM24S3EAM.

Методи дослідження. Збір, обробка та аналіз даних проводились із використанням спеціалізованого сейсмологічного програмного забезпечення SeisComP3, що підтримує як автоматичну, так і ручну обробку даних та інтерактивний перегляд результатів обробки.

Епіцентр і глибина джерела землетрусу визначалися із застосуванням методу LocSAT, що використовує одномірну модель земної кори [Bratt, Nagy, 1991]. Оператор має змогу змінити, додати чи прибрати час вступу фаз сигналу на станції, у такий спосіб досягаючи мінімальних похибок.

Для визначення магнітуди використовувалися значення локальної магнітуди ML («магнітуди Ріхтера»): $ML = \log A_{\max} - \log A_0$, де A_0 — амплітуда еталонної події. Для $ML=0$ рівняння можна переписати як $ML = \log A_{\max} - 2,48 + 2,76 \log \Delta$, де Δ — відстань від станції до місця землетрусу. Формула використовується для значень $ML < 7$ на регіональних відстанях. Зазвичай цю магнітуду розраховано по горизонтальним каналам для S -хвилі. Магнітуда ML_v є модифікацією ML для вертикальних каналів. Використовується для сейсмічних станцій на відстанях менше 8 градусів.

За вступами об'ємних хвиль визначається магнітуда m_b , що призначена для телесейсмічних відстаней, однак її використання допустиме з відстані 5 градусів, коли вже є чітка пряма фаза P -хвилі: $m_b = \log(A/T) + Q(h, \Delta)$, де A — амплітуда зміщення в мікрометрах, T — переважаючий період в секундах, Q — поправочний коефіцієнт для відстані (Δ) та глибини (h).

Розрахунок інтенсивності землетрусу для глибокофокусного регіону Карпат зони Вранча проводиться з використанням магнітуди m_b : $I = 1,9m_b + 4,8 \log(h^2 + \Delta^2)^{1/2} + 5$.

Для решти території використовується магнітуда ML (ML_v): $I = 1,9ML(ML_v) + 3,5 \log(h^2 + \Delta^2)^{1/2} + 3$, де в обох виразах Δ — відстань, h — глибина.

Національний сейсмологічний національний бюлєтень України за 2021 р. За інструментальними даними у 2021 р. на території України та суміжних держав відбулося більш ніж півтори сотні землетрусів, основна частина яких приурочена до глибокофокусної зони Вранча (Румунія). Максимальна зафіксована магнітуда землетрусу — 4,6. Землетруси з території інших суміжних держав мали локальний характер і не впливали суттєво на сейсмічність території України.

Примітка: Guralp CMG-40T, CMG-3T, CMG-3ESPV — широкополосні сейсмометри компанії Guralp Systems Ltd (England); STS-2,5, STS-1V/VBB — Streckeisen Seismic Instrumentation (Switzerland); EpiSensorES-T — акселерометри виробництва Kinematics (USA); Quanterra Q330 — цифровий перетворювач фірми Quanterra Environmental Processor used in IRISUS Array/TA and GSN stations (Quanterra, Inc., USA); VLPSSL-210 GEOTECH — vertical long-period seismometer model SL-210 and HLPSSL-220 — horizontal long-period seismometers model SL-220 (Geotech Instruments, LLC, USA); DAS (Digital automatic seismometer); 03, 04, 05 — generation of digital automatic seismometer (розроблені в ГГФ); CKM-3 — сейсмометр Кірноса; СКА — Авоголійдерний сейсмометр; CM-3KB магнітотелуричний сейсмометр; IGPH Seismometer, IGPH Datalogger — копія сейсмометра Guralp CMG-40 і цифровий перетворювач, розроблені в ГГФ І.Ю. Михайлком.

На території України більшість епіцентрів зареєстрованих землетрусів знаходиться в межах Волино-Поділля та Передкарпатського прогину на граници Складчастих Карпат. 23 вересня на Тернопільщині було зафіксовано землетрус з магнітудою 4,3 і розрахунковою інтенсивністю 5 балів. За результатами опитування, поки трусило кілька секунд людям було страшно. Поштовхи відчували в радіусі майже 100 км щонайменше у шести областях (Чернівецькій, Вінницькій, Львівській, Рівненській, Івано-Франківській та Хмельницькій). Приклад його обробки наведено нижче. У 2019 та 2020 рр. у цій області вже відбувалися землетруси, сила яких становила 2 бали. У Кримсько-Чорноморському регіоні спостерігалася слабка сейсмічність, епіцентри землетрусів були зосереджені в межах морської акваторії.

На територіях України, Румунії, Польщі, Молдови, Словаччини, Угорщини та Білорусі зареєстровано землетруси, які приведено у вигляді каталогів з детальною

інформацією про них. Землетруси, що відбулись у 2021 р. на території України та на території суміжних держав викладено у вигляді таблиці (табл. 2) і на гугл карті рис. 3.

Обробка сейсмічних подій. У табл. 3 та 4 наведено приклади обробки землетрусів 03.02.2021 та 23.09.2021, де вказано час, координати події, глибину гіпоцентру h , магнітуду та назви станцій, згідно з якими виконано релокацію події.

Землетрус 03.02.2021 (район Вранча, Румунія) зареєстровано 29 станціями (див. рис. 3, табл. 3). Параметри: $t_0=00:52:58$; $\phi=45,82^\circ\text{N}$; $\lambda=26,62^\circ\text{E}$; $h=109$ км; $MLv=3,6$.

Землетрус 23.09.2021. (Тернопільська обл., Україна) зареєстровано 44 станціями (див. рис. 4, табл. 4). Параметри: $t_0=03:18:04$; $\phi=48,87^\circ\text{N}$; $\lambda=25,68^\circ\text{E}$; $h=6$ км; $m_b=4,3$.

Дані про параметри зареєстрованих сейсмічних подій у табличному вигляді автоматично формуються за допомогою спеціалізованого програмного забезпечення SeisComp3, що є найпоширенішим

Рис. 3. Розташування епіцентрів землетрусів за 2021 р., зареєстрованих Національною сейсмологічною системою спостережень України.

Fig. 3. Location of epicenters of earthquakes for 2021, registered by the National Seismological Monitoring System of Ukraine.

Т а б л и ц я 2. Каталог землетрусів за 2021 р.

Примітки: Sta — маркування сейсмічних станцій, які задіяні у обробці; Dist — епіцентральна відстань; EvAz — азимут напрямку з епіцентру на станцію, визначений за координатами епіцентру, град; Phase — фаза вступу сейсмічної хвилі; Time — час вступу сейсмічної хвилі; RMS — середньоквадратична нев'язка часу пробігу.

програмним пакетом для моніторингу землетрусів та інших сейсмічних подій у реальному часі. Він забезпечує автоматичний та інтерактивний збір, обробку та обмін сейсмологічними даними.

Висновки. Сейсмологічна мережа спо-

стережень є комплексом систем, який складається із стаціонарних сейсмологічних пунктів реєстрації сейсмічних хвиль, розподіленої системи передачі і збору сейсмологічної інформації, а також центру оперативного опрацювання даних,

Рис. 4. Положення землетрусу 03.02.2021 (район Вранча, Румунія).

Fig. 4. Location of the earthquake on February 3, 2021 (Vrancea region, Romania).

які надходять з пунктів реєстрації даних. Проведення режимних сейсмологічних спостережень за локальними і віддаленими сейсмічними подіями, уdosконалення методики обробки отриманих записів, комплексна обробка зареєстрованих подій необхідні для виділення локальних землетрусів та оцінювання сучасної активності тектонічних структур у межах території України.

Сейсмологічною мережею у 2021 р. на території України та суміжних держав зареєстровано більш ніж півтори сотні землетрусів, основна частина яких приурочена до глибокофокусної зони Вранча (Румунія). Максимальна зафіксована магнітуда румунського землетрусу — 4,6. Найпотужніший землетрус магнітудою 4,3 на території України відбувся 23 вересня на Тернопільщині, розрахункова інтенсивність в епіцентрі 5 балів. Землетруси з те-

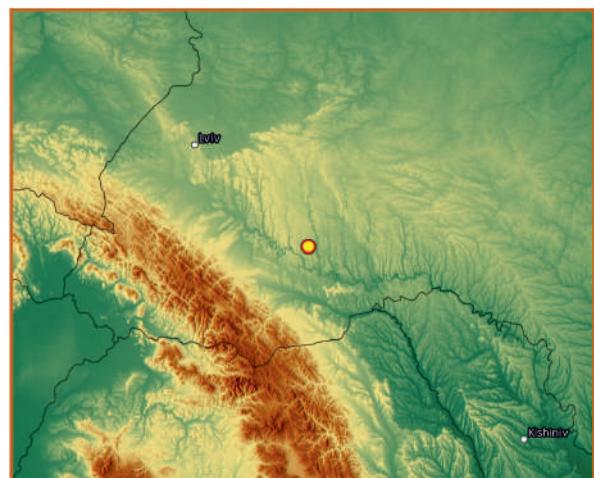

Рис. 5. Положення землетрусу 23.09.2021 (Тернопільська обл., Україна).

Fig. 5. Location of the earthquake on September 23, 2021 (Ternopil region, Ukraine).

риторій інших суміжних держав мали локальний характер і суттєво не впливали на сейсмічність території України. Більшість епіцентрів зареєстрованих землетрусів на території України знаходиться в межах Волино-Поділля та Передкарпатського прогину на межі Складчастих Карпат.

Інформацію щодо кожного землетрусу з Каталогу землетрусів за 2021 р. (див. табл. 2) у повному обсязі наведено у pdf-файлі бюллетеня на сайті «Геофізичного журналу».

Для забезпечення високоякісними даними сейсмологічних спостережень та надійного визначення рівня і кількісних характеристик сейсмічної небезпеки території України необхідне суттєве розширення сейсмологічної мережі та облаштування її сучасною цифровою реєструючою апаратурою.

⁴GFZ German Research Centre for Geosciences, Potsdam, Germany

The National System of seismic observations of Ukraine has accumulated a network of observation seismic points the joint management of the S.I. Subbotin Institute of Geophysics of National Academy of Sciences of Ukraine and the Main Special Monitoring Center of the State Space Agency of Ukraine. The two institutions together established a joint National database in which the observations are collected, processed and analyzed. Alongside live updates, the data are systematized as seismological bulletins and earthquake catalogs.

According to the data, in Ukraine and the nearby countries there happened in 2021 over one hundred fifty earthquakes. Most of them occurred in the deep-focus Vrancea region (Romania). The maximum recorded magnitude was 4.6; the earthquakes in the nearby countries were local in scope and had no significant effect on the seismicity in Ukraine. The largest earthquake in Ukraine ($t_0=03:18:04$; $\phi=48.87^{\circ}\text{N}$; $\lambda=25.68^{\circ}\text{E}$; $h=6\text{ km}$; $m_b=4.3$) occurred on September 23 in the Ternopil region.

In Ukraine, most epicenters of the recorded earthquakes lie in the Volyn-Podillya area and the Forecarpathian fold at the edge of the Folded Carpathians. In the Crimean-Black Sea region, there was weak seismicity with earthquake epicenters concentrated in the sea.

The Seismological bulletin of Ukraine contains detailed information on all seismic events which happened in Ukraine, Romania, Poland, Moldova, Slovakia, Hungary, and Belarus.

The full information for every earthquake in the Earthquake Catalog 2021 is given in the PDF version of this article on the website of the Geofizicheskiy Zhurnal.

Key words: earthquake, seismological network, magnitude, epicentral distance, Vrancea region, seismological bulleten.

1. The Ukrainian National Seismological Network

The national system of seismic observations of Ukraine currently consists of observation points of the Institute of Geophysics by S.I. Subbotin name of the National Academy of Sciences (IGPH) and the Main Center for Special Monitoring (MCSM) of the State space agency of Ukraine, and their computing centers together form the National Data Center (NDC).

The density of the network of permanently operating seismic stations of the Institute of Geophysics is dense in the western regions of Ukraine, which is served by the Carpathian Department of Seismicity. There are 22 seismic stations operating in the Carpathian region of Ukraine, the vast majority of which are equipped with DAS-04 digital seismic stations. A small number of seismic stations operate in the rest of Ukraine and are serviced by the Kyiv Department of Seismic Hazards.

The seismological network of the Main Center for Special Monitoring consists of 11 observation points, most of which are located in the northern and central parts of the territory of Ukraine. Observation points are equipped with broadband digital seismic stations. In addition, the Main Center maintains an automated set of seismic grouping equipment, included as a primary station (PS-45) in the International Monitoring System (IMS). The station is a territorially distributed system of collecting seismological information, consisting of 22 boreholes and one mine element located near the technical site. Vertical short-period seismic receivers CMG - 3ESPV are installed in the wells, and three-component broadband seismic receiver CMG - 3T is installed in the mine. Signals from each sensor are converted into digital form using the analog-to-digital converter CMG-DM24S3EAM.

IGPH - Institute of geophysics by S.I. Subbotin name;

MCSM - The main center of special monitoring;

NNEGC "Energoatom" - National Nuclear Energy Generating Company «Energoatom»;

CD IGPH - Carpathian Department of Seismicity (IGPH);

Guralp CMG-40T, CMG-3T, CMG - 3ESPV – broadband seismometers of Guralp Systems Ltd (England);

STS-2.5, STS-1V/VBB - Streckeisen Seismic Instrumentation (Switzerland);

EpiSensor ES-T – accelerometers manufactured by Kinematics (USA);

Quanterra Q330 – Quanterra Environmental Processor used in IRIS USArray/TA and GSN stations (Quanterra, Inc., USA);

VLPS SL-210 GEOTECH - vertical long-period seismometer model SL-210 and HLPS SL-220 - horizontal long-period seismometers model SL-220 (Geotech Instruments, LLC, USA);

DAS (Digital automatic seismometer); 03, 04, 05 – generation of digital automatic seismometer (made by Institute of geophysics (IGPH));

CKM-3 Kirnos seismometer;

СКД – long-period seismometer;

CM-3KB - magnetotelluric seismometer;

IGPH Seismometr, IGPH Datalogger – a copy of the Guralp CMG-40 seismometer and a digital converter developed at the Institute of Geophysics by Mykhailik I.

UKRAINIAN NATIONAL SEISMOLOGICAL BULLETIN 2021

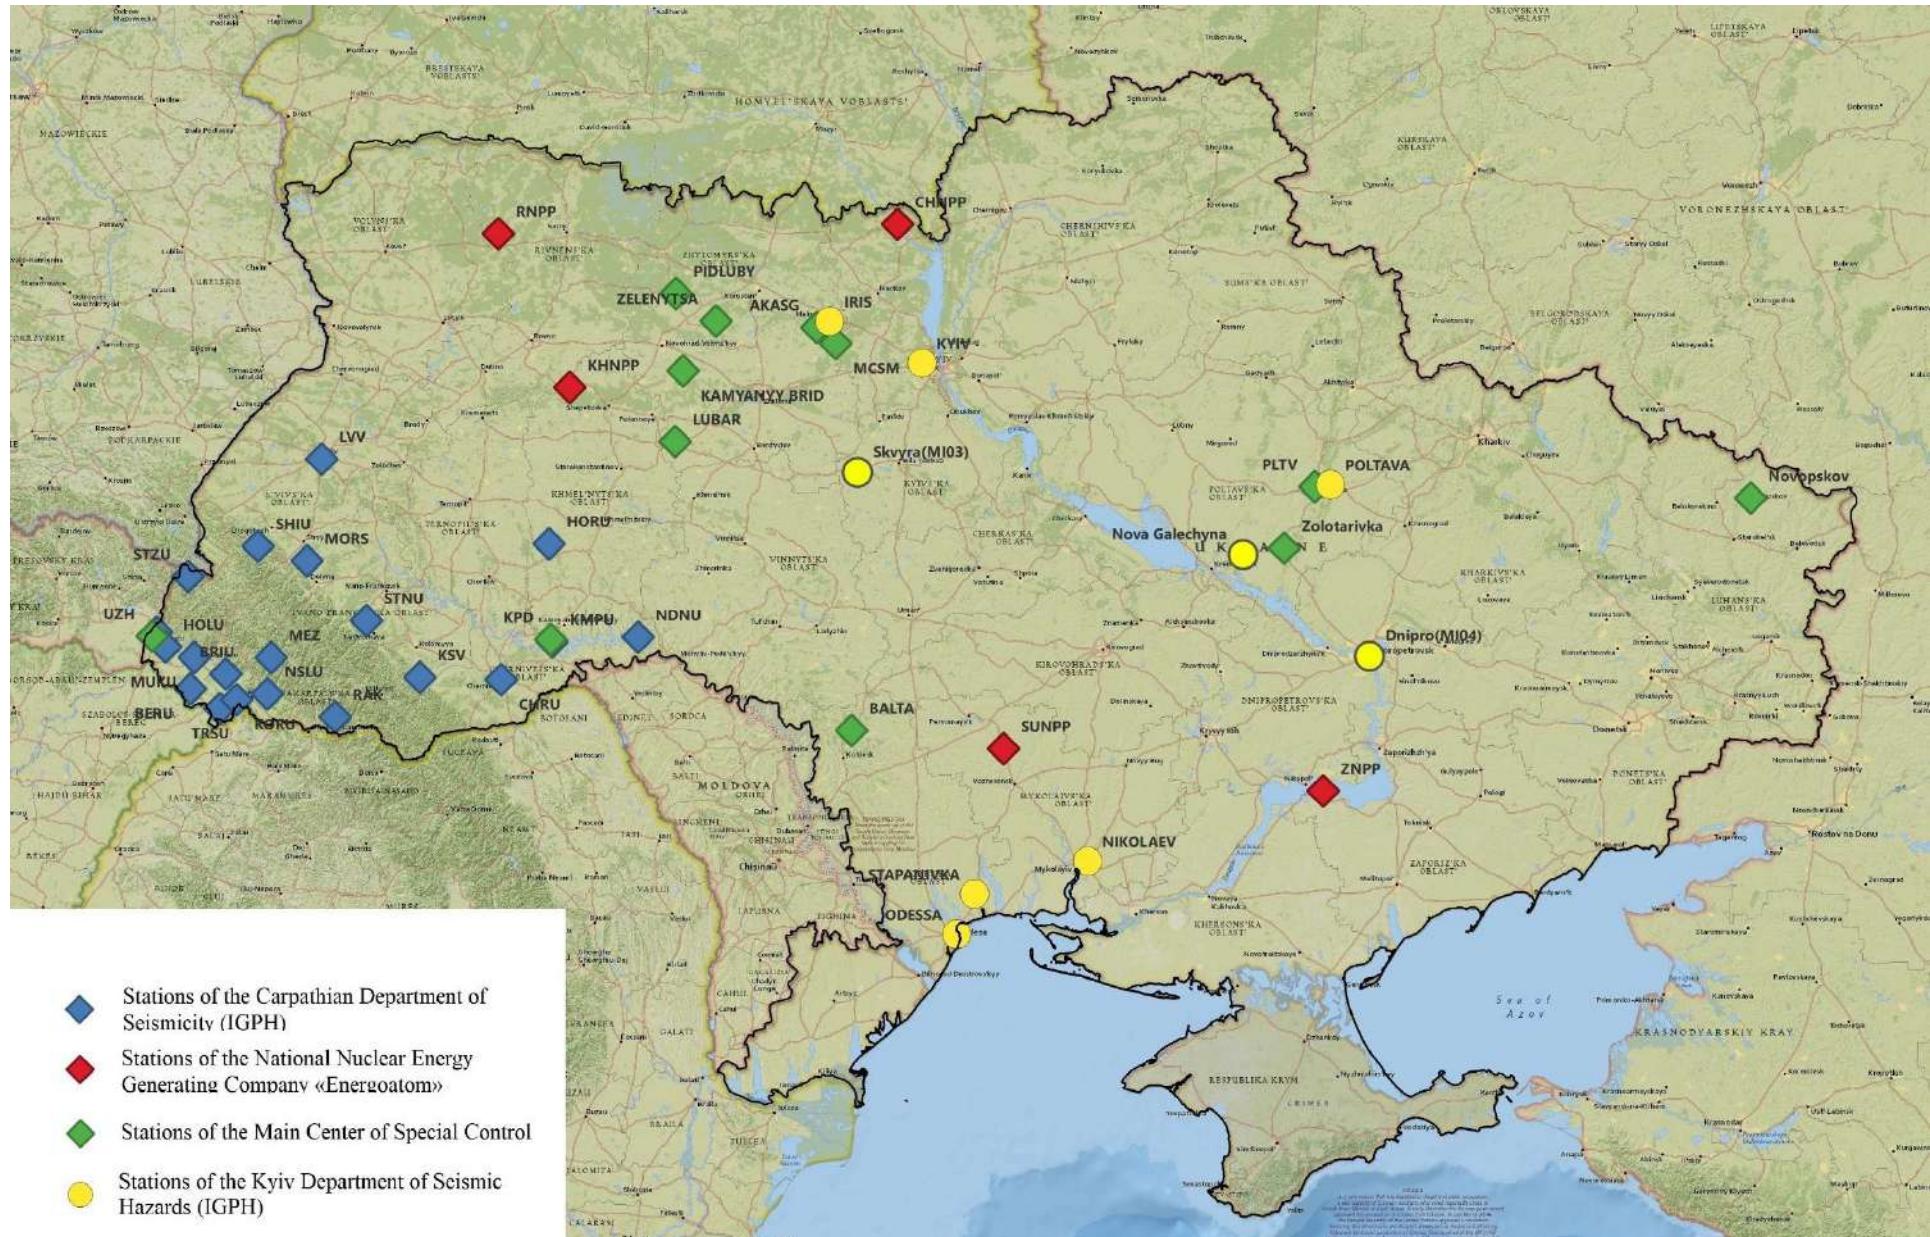

Figure 1. Stations of the Ukrainian National Seismological Network in 2021

2. Local events

In 2021, 2157 local events have been detected by the Ukrainian National Seismological Network. From these events, 158 earthquakes (Table. 2.1) and 1999 quarry explosions (Table. 2.2) have been identified.

The most of epicenters were located within the seismically active Vrancea zone, Romania (65 seismic events) among all earthquakes that were registered in 2021 on the territory of Ukraine and neighboring countries. The most powerful earthquake in this region had a magnitude of 4.6. The estimated intensity of shaking on the territory of Ukraine was 3 points.

In general, stations of the Ukrainian National Seismological Network registered about 30 local earthquakes on the territory of Ukraine in 2021. The epicenters of the majority of earthquakes are located within the Transcarpathia, Ivano-Frankivsk and Chernivtsi regions. The magnitude values of seismic events range from 1.4 to 4.3. The most powerful earthquake near the Chortkiv town on September 23, 2021 had a magnitude of $mb = 4.3$ and an intensity of up to 5 points at the epicenter. Comparison of the distribution of the epicenters of these earthquakes with the fault tectonics of the southwestern part of the East European Craton shows that the sources of seismic events are confined mainly to different fault zones. The main number of epicenters of registered local earthquakes is located within the Volyn-Podillya and Precarpathian trough on the border of the Folded Carpathians. In the Crimean-Black Sea region, weak seismicity was observed during the year, earthquake epicenters were concentrated within the sea area.

Earthquakes in Poland, Moldova, Slovakia, Hungary and Belarus were local in nature and did not significantly affect the seismicity of the territory of Ukraine.

Table 2.1: Parameters of earthquakes detected by the Ukrainian National Seismological Network
